

## NETWORK QUALITY ASSURANCE SOLUTION

Quality Assurance is the foundation of all International IT standards and government compliance requirements. Industry solutions such as log aggregation and event management products focus on response management, not quality assurance, and are expensive to acquire and complex to implement and use.

By creating a centralized reporting solution that collects & analyzes data directly from the network and not from individual device logs, Congruity offers organizations the only truly objective reporting solution for managing to IT standards and Network Quality Assurance (NQA) best practices. With Congruity Inspector™, a single mouse-click is all that's required to verify the effectiveness of internal controls, policies, communications, highlight internal and external threats and document compliance efforts.

Congruity Inspector™ is easy-to-install, fully automated, and totally non-disruptive to the network. It provides a consistent, clear and unbiased picture of network operation status that any executive, IT manager or auditor can review and understand. Congruity Inspector™ offers enterprise reporting features but is designed to be both practical and extremely affordable.

### TRANSPARENT, UNBIASED IT OPERATIONS & BUSINESS REPORTING

When stakeholders, IT managers or auditors need documentation and assurances that IT systems and data usage meet expectations, someone must review the firewall, IDS, Email systems, Web filter, host and workstation logs. Congruity Inspector™ saves time and money over all other solutions eliminating the effort and the guess work, enabling decision makers to efficiently report on system performance and usage status in a consistent, quality-focused manner.

#### Solution Overview

Feature	Advantage	Benefit
Installs/configures in minutes	Minimal IT resources needed	No disruption to network
Centralized, network-level data source	Single PC install, no agents required	Objective audit/compliance verification
Fully-automated process	Requires no resources or effort to operate	Reduces costs, improves productivity
All-in-one Web console & exec reports	Perimeter, communications, compliance status	Improves communications & planning
7x24 trace of every communication flow	Concurrent view of all system use & trends	Improves IT troubleshooting/helpdesk
On-demand assessment	Predicable results, gap analysis	Improves audit preparation & results
Consistent Network Quality Assurance process	Eliminates subjective manual data collection	Best practices in IT management

#### Network Quality Assurance Software Business Highlights

**One-Click Reporting & Regulatory Compliance:** HIPAA, GLBA, FISMA, CIPA, SOX

**Centralized Network & System Reporting:** More affordable and easier to use than log management tools

**Proactive Management & Maintenance:** Reduce network/business disruption & help desk calls

**Profiles all communications & content:** identify misuse, abuse or errors that expose IT systems & data

**Labor and cost savings:** Eliminates manual data collection and audit report preparation time

**System & Network Requirements:** Installs on a single standard Windows XP, 2003, 2000 or NT PC. Must be connected to a monitoring port "Tap Point" on the Internet gateway switch/router and be able to see both inbound and outbound traffic. This is the same connection point for installing Snort, Sniffer or Ethereal or any other deep network inspection solution.
